

MODULE-2

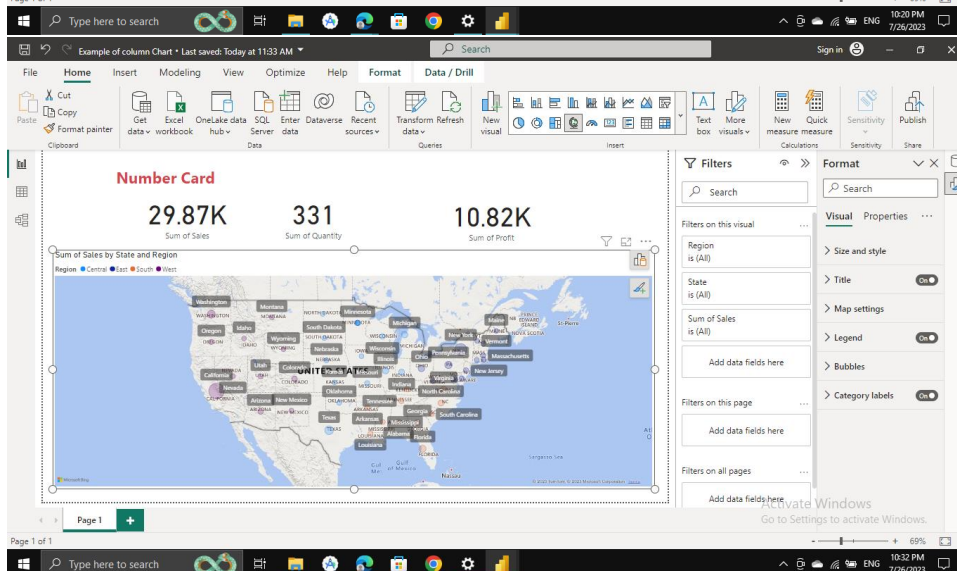

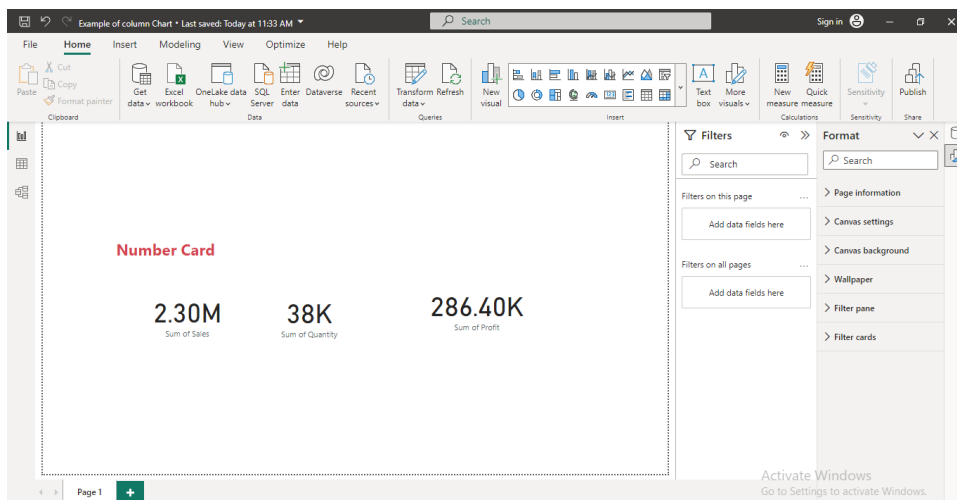

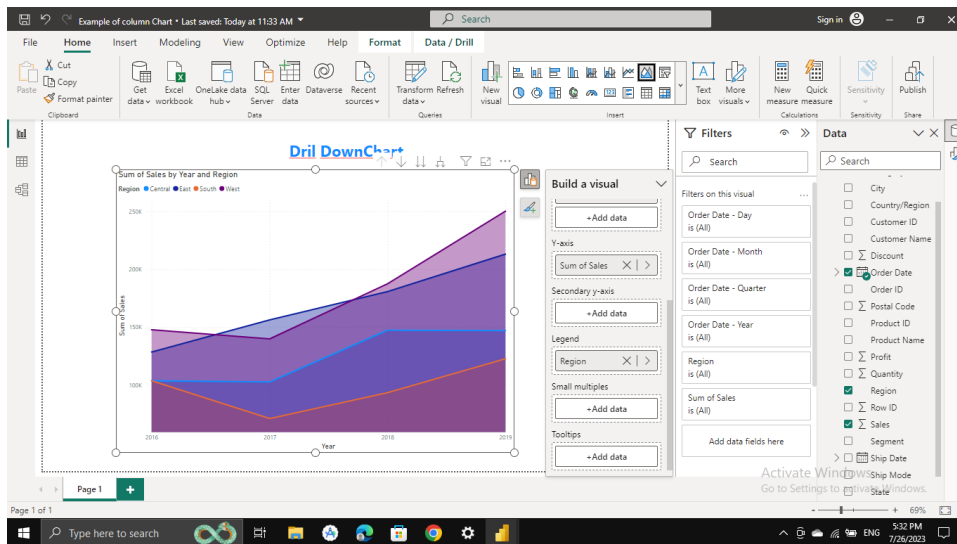

▼ Module 2: Managing Basic Visuals in Power BI

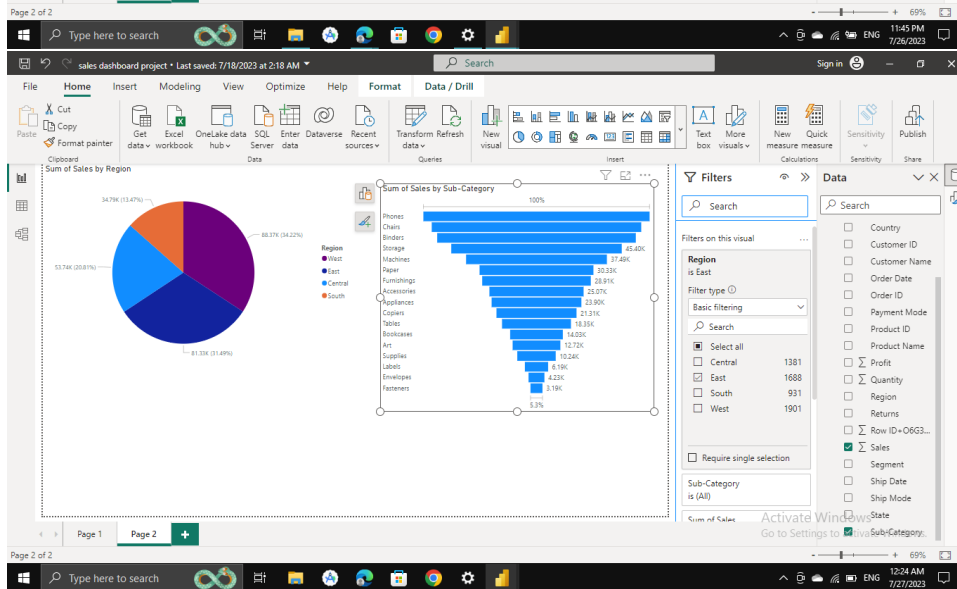

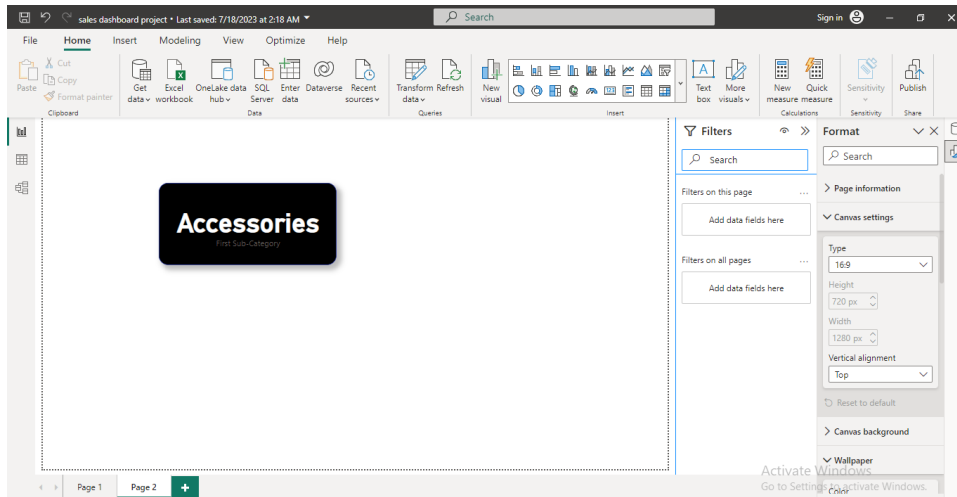

Learning Outcomes

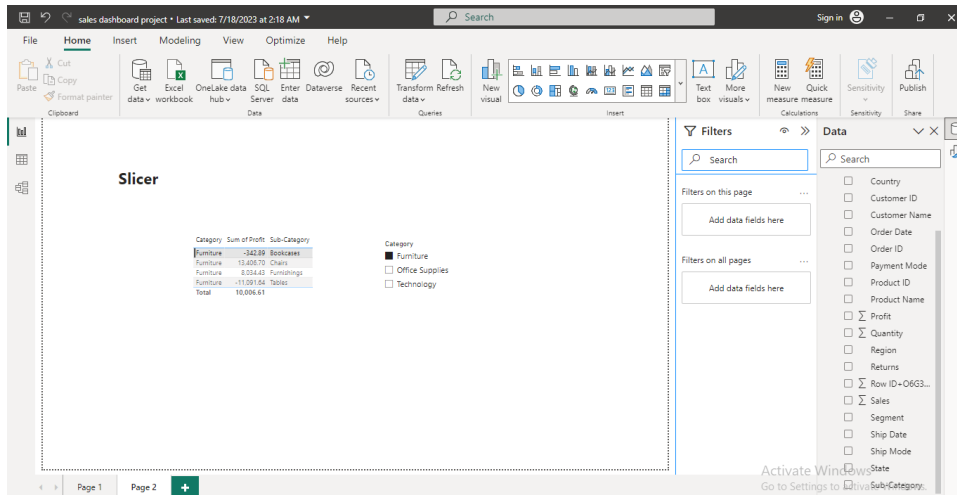

By the completion of this module you will be able to:

- Indicate the use of drill down in a line chart.
- List the uses of the other eight basic charts in Microsoft Power BI.
- Select the right tools to format and modify cards.
- Define what slicers are in Power BI.
- State the various purposes slicers can have.

PROGRESS SAVED

Lesson Summary

The key points from this module are the following:

- A line chart is used for a date data type. For example, we can view how many sales your business did in 2021 in contrast to 2020.
- Scatter plot is the only animation chart by default in Microsoft Power BI.
- The drill-down tool serves us to view the data by quarter, month and day.
- A scatter plot chart is used when we want to visualize the distribution of measures or numeric values.
- To modify a card, we need to click on the tool that says "format". If you require the same format on multiple cards, select the desired card you want, click on formatting the painter, and finally click on the others.
- Slicers are interactive filters. There is only one slicer in Microsoft Power BI, but it can be used for multiple purposes such as text, data, reports, charts, maps or tables.
